---

(\*) - Installation documentation is included with the installation disc, should follow the proper format which have clear and complete content for anyone to perform.  
- The Center performs the installation and give a notification of the protection list for successfully. Project not successfully installed is Fail.

Step 3 . - The project uses netbean server, so it needs a server containing a database named "QLBanhangJavafx" for you to test run the project. Here I use SQL Management Studio 20 to create a localhost server

Step 4. Create a database name “QLBanhangJavafx” in SQL Server

Step 5. Open netbean tool to run the project

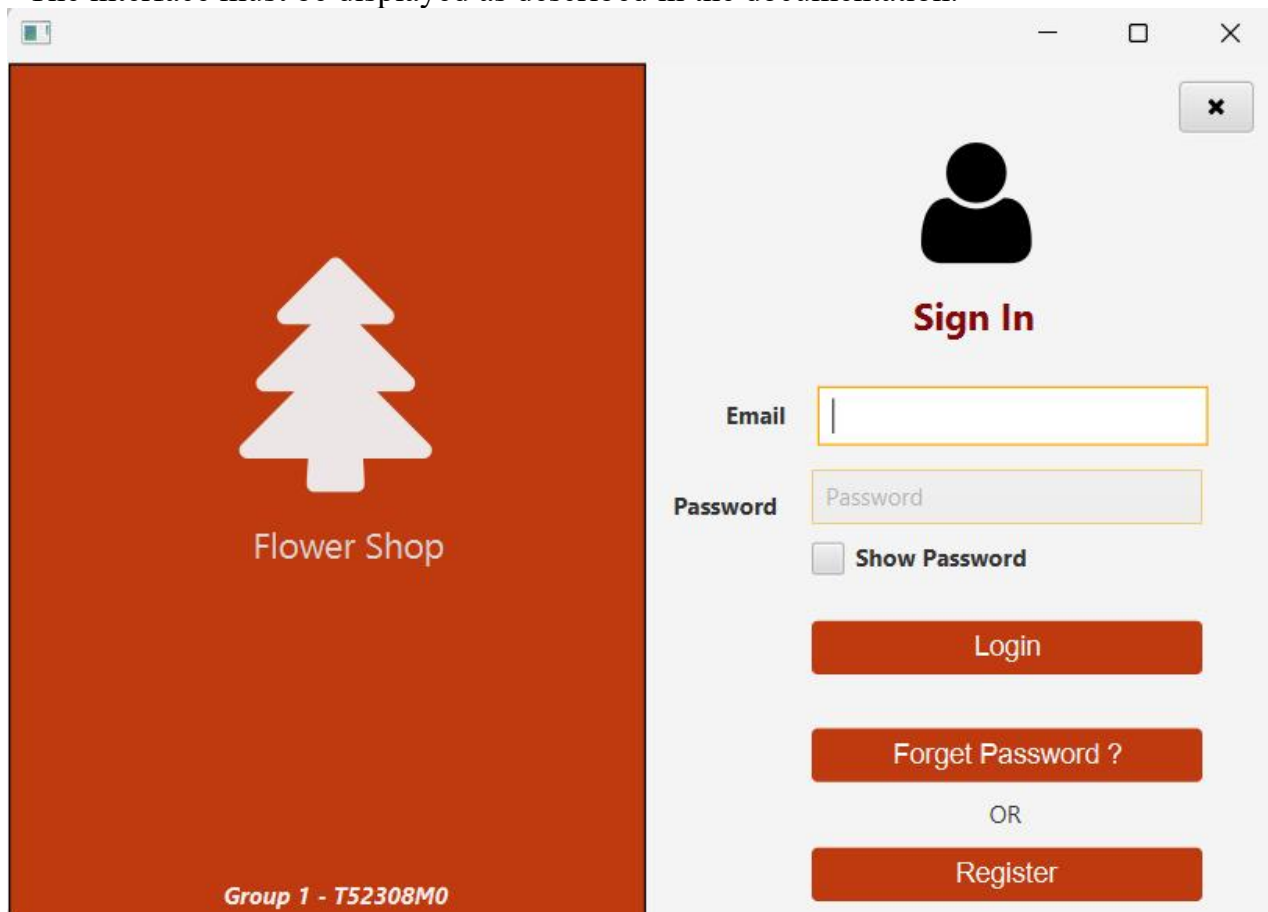

- (\*)
- Installation documentation is included with the installation disc, should follow the proper format which have clear and complete content for anyone to perform.
  - The Center performs the installation and give a notification of the protection list for successfully. Project not successfully installed is Fail.

## II. Download from GitHub:

- Step 1. In htdocs, right click and select Open Git Bash here.  
Step 2. Run the following command:  
`git clone https://github.com/bichlienho/FlowershopG1.git`

## C. Successful test

- File was downloaded successfully
- The interface must be displayed as described in the documentation.
